

Washington State | February 2018-June 2018

HABITAT NETWORK is a citizen science project designed to cultivate a richer understanding of wildlife habitat for both professional scientists and people concerned with their local environments. Data is being collected by volunteers who draw maps of their backyards, parks, farms, favorite birding locations, schools, and gardens. The Nature Conservancy in Washington has a goal of using this resource to map all of our preserves, all of our City Habitat partner projects, and as many yards, schools, and neighborhood parks as possible in 2018.

To achieve this goal we are recruiting a team

of volunteers to take personal responsibility for mapping their nearby preserve and local urban conservation projects.

Volunteers can choose from these three training options:

SEATTLE Monday, February 12th, 6:30-8:30pm

PUYALLUP Tuesday, February 13th, 6-8pm

VIRTUAL Wednesday, February 14th, noon-2pm

If you live near or steward one of our preserves, or live in Seattle or Tacoma, this is a great project you can take on that is flexible with your schedule and will inform conservation and urban planning decisions in years to come.

IF YOU ARE INTERESTED IN VOLUNTEERING FOR THIS PROJECT
please email wavolunteer@tnc.org with a message that highlights any special skills/
experience, and what city/neighborhood you would like to volunteer in.
